

QUATTROLIFTS HORIZON

The HORIZON is a glass lifter designed for in shop use to assist glass workers to unload, rotate, transport and lay large plates of glass flat onto a cutting table or tempering line. It has a lifting capacity of 300 Kg's (660 Lbs.). It can rotate glass measuring up to 4400 mm (180"). The Horizon has a 12 volt battery powered vacuum pump and 2 hydraulic rams.

QUATTROLIFTS have released a new glass lifting machine called the Horizon that will lift and tilt glass to the horizontal. The Horizon will allow one operator to lift glass or an IGU from a rack or truck and then index the glass to the horizontal and then slowly and precisely lower it onto a table or into a frame.

The HORIZON will allow one or two people to do what use to require four to six people in the past with greater safety. This is perfect for setting DGU's into a window frame to create a perfect seal.

The HORIZON can lift 3660 x 2440mm stock sheets of glass and transport them around your factory with ease. The Horizon also allows the operator to rotate the glass 90 degrees which is ideal for edgework machines.
